

KEK

Development of Triggered Scaler and its Field Tests in J-PARC #1

N. Kamikubota and K.C.Sato, J-PARC/KEK

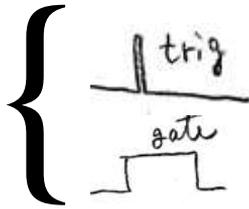

June 2018 in ANL, kami, J-PARC/KEK

Motivation

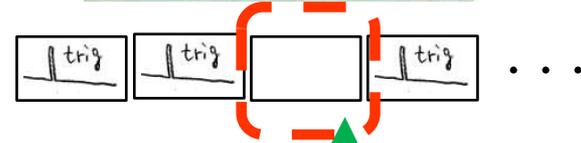

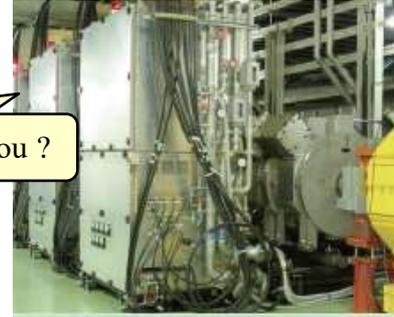

Event Timing System
(J-parc original, VME, not MRF)

Pwr-supply, beam-diag., ..
(Photo is RF cavities in J-parc MR)

I do generate signals for you !

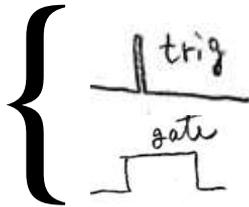

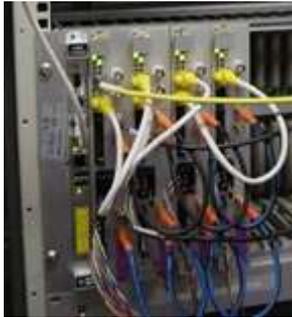

Ah, you missed one shot, don't you ?

Motivation

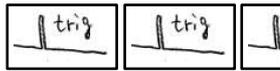

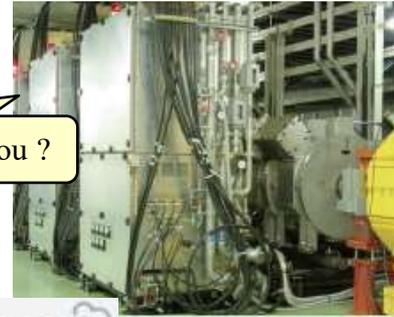

Event Timing System
(J-parc original, VME, not MRF)

Pwr-supply, beam-diag., ..
(Photo is RF cavities in J-parc MR)

I do generate signals for you !

Ah, you missed one shot, don't you ?

It's a fault of your side !

No, I am always perfect !

Did you check your system ?

How about you ?

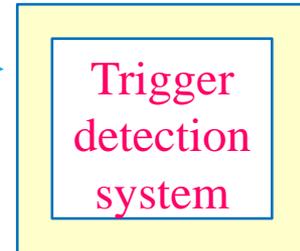

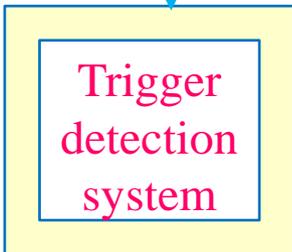

To find an origin of miss-trigger is not easy ..

Typical transfer line is a fiber-optic cable: 10-50m in MR
(E/O and O/E modules exist between)

- Develop a new "trigger detection system" designed for J-PARC accel. timing structure
25Hz (for LI,RCS) and 2.48s/5.20s (for MR, "Machine Cycle")

June 2018 in ANL, kami, J-PARC/KEK

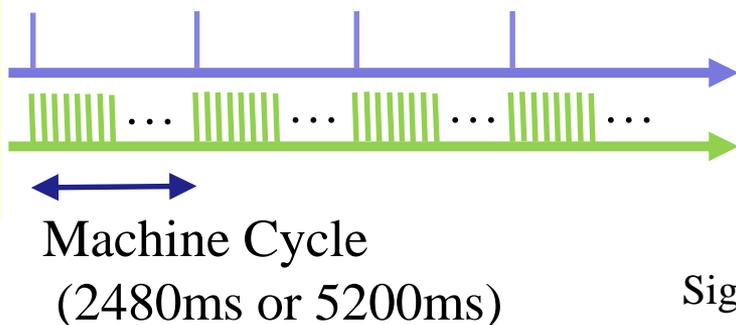

What is “Triggered Scaler” ?

- a scaler with dual memory-buffers
- a Yokogawa PLC-type module
- Prototype in 2016, now(2018) in field test

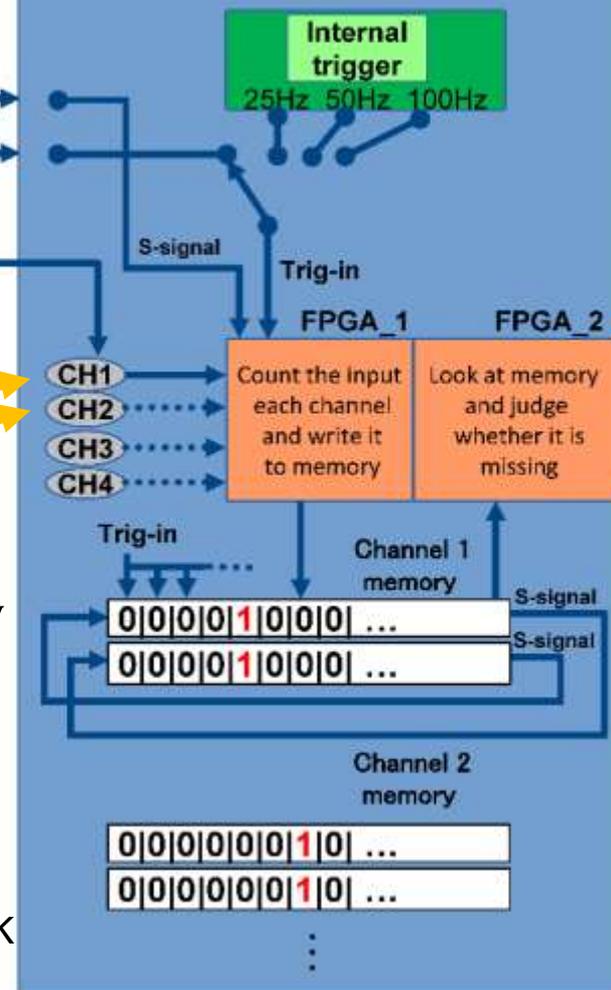

J-PARC
Timing
System

Signals to be measured

Triggered scaler

The module (FPGA_1)

- count number of pulses in 40ms-bin, store it in memory
- “Trig-in” shifts the pointer to a memory buffer
- “S-in” changes the memory buffer (+ clear pointer position)
- dual buffers, each has 192 elements (max 7680ms)

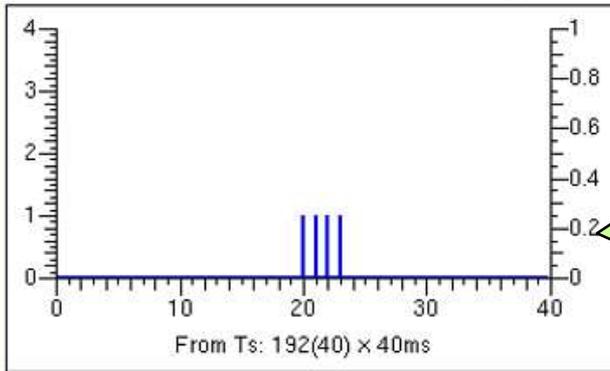

When a miss-trigger occurs

- How “K1-K4” triggers looks like ?

Normal

(renewed every Machine Cycle)

TS-ch3 (K1-K4 from RCS)

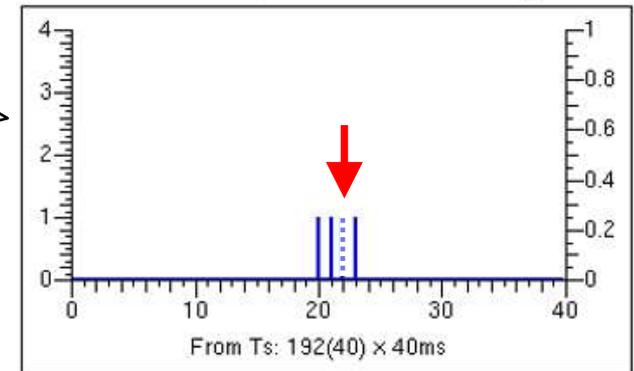

Observed

Expect

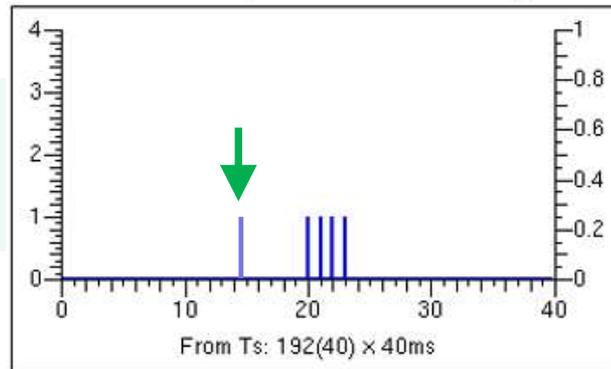

miss-trigger

TS-ch3 (K1-K4 from RCS)

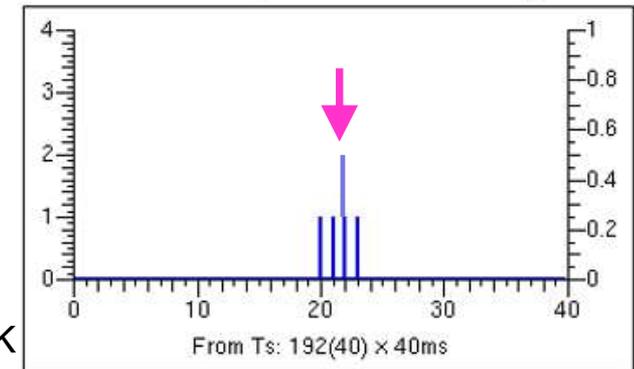

irregular trigger (by noise) double trigger (bad termination)

TS-ch3 (K1-K4 from RCS)

TS-ch3 (K1-K4 from RCS)

Plan to detect miss-triggers is in progress

K

Summary

- "Triggered scaler" has been developed for J-PARC accelerator
 - as a Yokogawa plc module
 - prototype version
 - filed tests started since Jan.2018
- Basic functionalities were confirmed
 - it works ! as we expected
 - plan to detect miss-trigger events is in progress

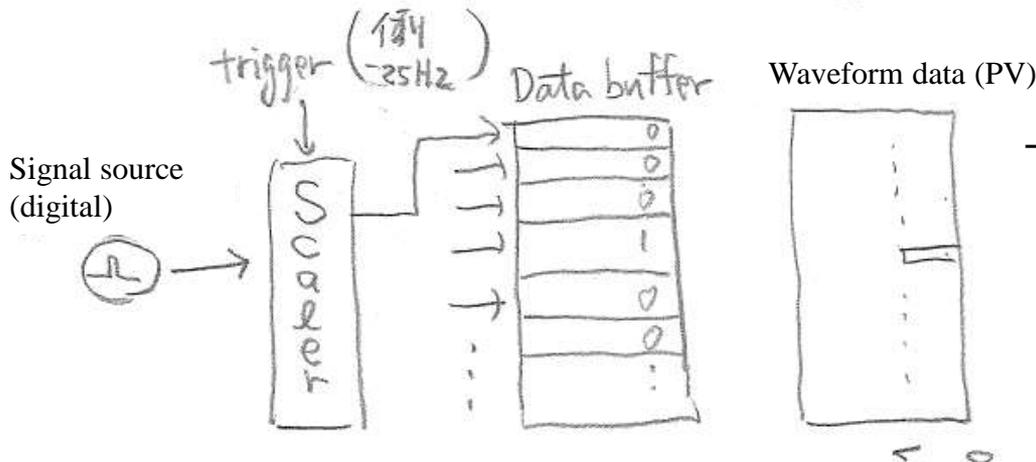

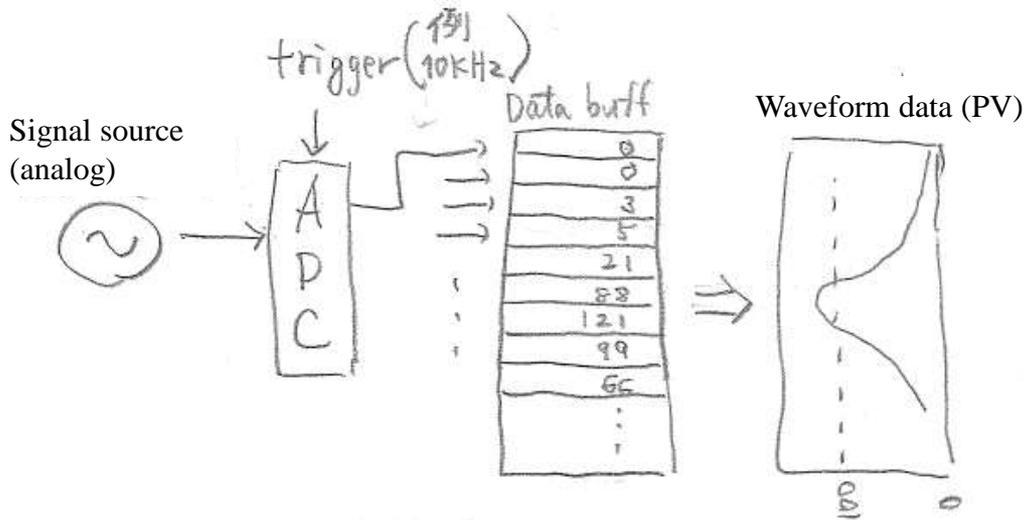

**Next talk will show
other demonstrations**

Appendix: backup

What is Triggered Scaler (続き)

- 機能比較

- **Digitizer (triggered ADC) and Triggered Scaler**

- Triggered Scaler for J-PARC MR:
 - default trig. rate is **25Hz** (up to 1kHz)
 - **buffer size is 192/ch**, each element 16bit
 - (not shown in the figure)
 - double-buffer**, switch-over is made by external S-signal (start of Machine Cycle)

J-PARC Timing: Facts in short

1.J-PARC is an accelerator complex located in Ibaraki, Japan

1. **Rapid** cycle: LI(400MeV Linac) and RCS(3GeV) - **25Hz**
2. **Slow** cycle: MR(30GeV Main Ring) - **2.48s or 5.52s** (5.20s after Jan.2018)

2.Hardware

1. **Home-design VME modules** for control, NIM modules for signal generation (not MRF-based)

3.Software

1. Developed by ourselves
2. EPICS and its tools are used in general
3. Java and python are preferred for table-data handling (epics waveform)

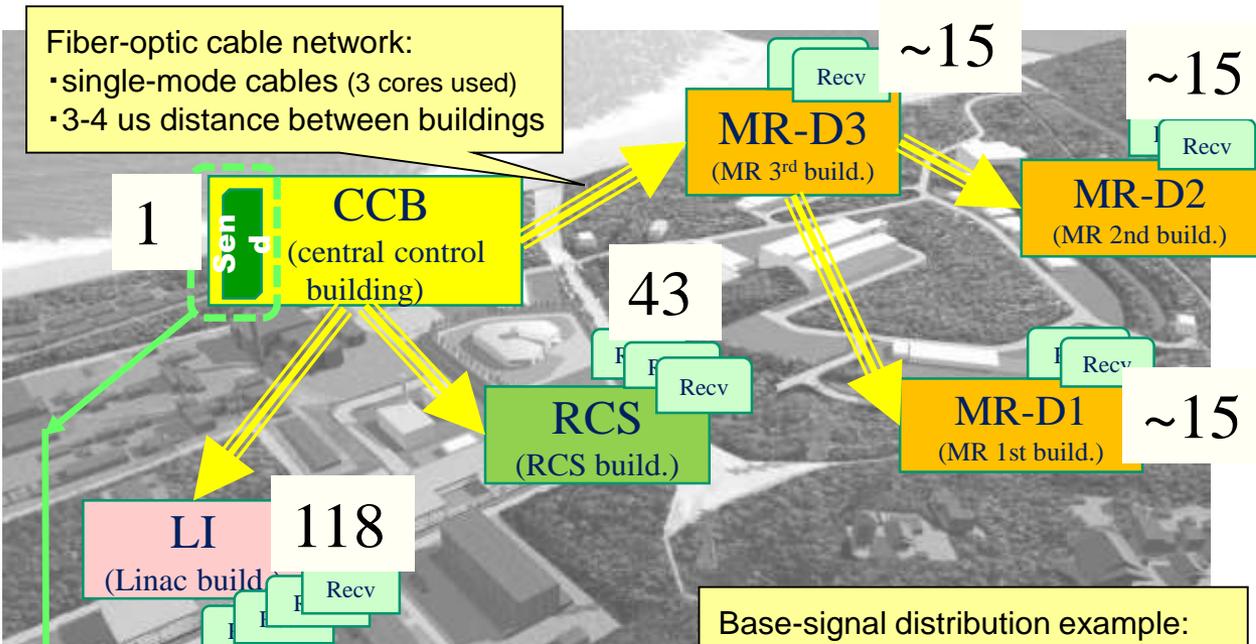

4.Scale of the system

1. One Send-module (=EVG)
2. LI/RCS/MR – **118/43/45 VME receiver-modules(EVR)**, **~540/220/300 endpoints**

Base-Signal Distribution and VME/NIM Modules

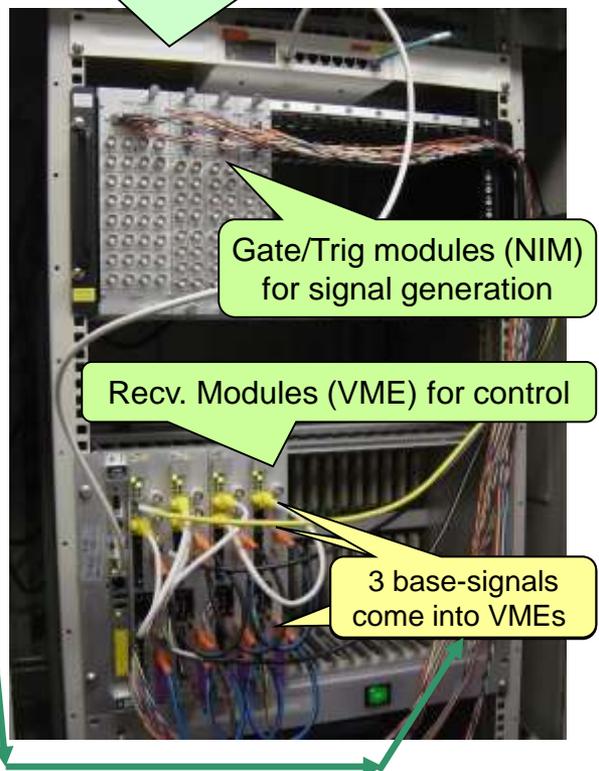

Fiber-optic cable network:

- single-mode cables (3 cores used)
- 3-4 us distance between buildings

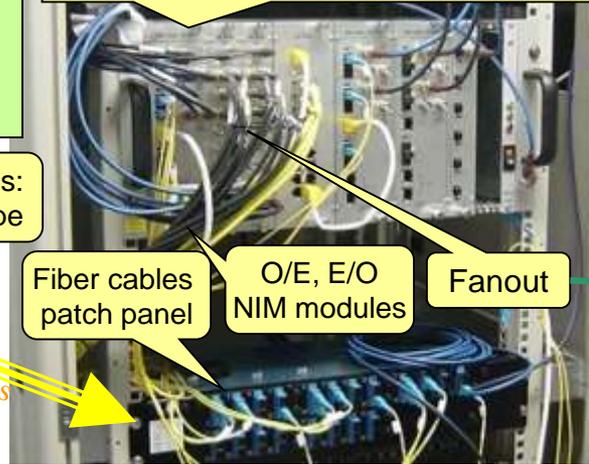

End-point example at MR-D3:

- UP: 4 NIM modules
1 gate module (4 signals)
3 trigger modules (8 signals each)
- DOWN: 4 VME Recv. Modules
each module controls one NIM module

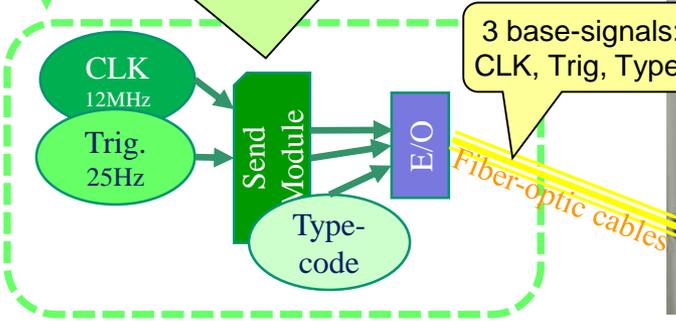

Base-signal distribution example:

- E/O, O/E, and fanout NIM modules

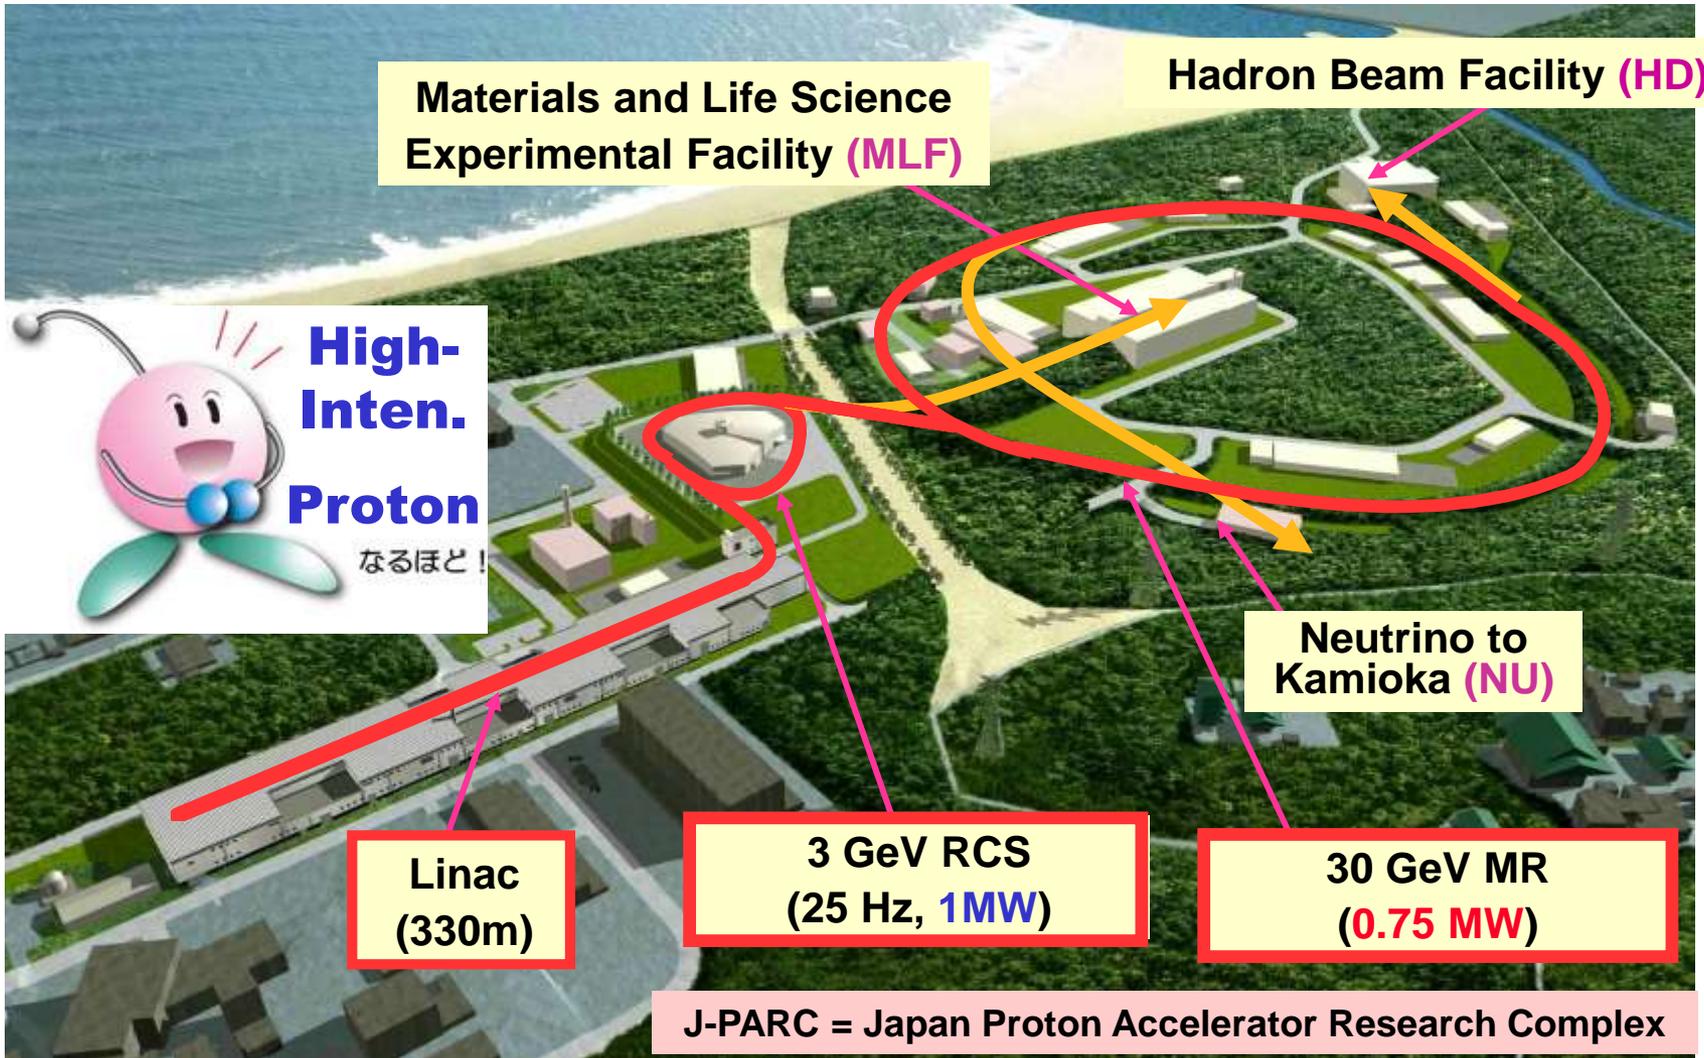

Send module located in the CCB:

- is a VME module, only one exists
- 2 Base-signals (CLK, Trig) come in
- generates series of Type-codes
